

mix2: CATch stays inside the 5% do-no-harm band; two of three SpiderSense picks push a tenant past -15%

Victims sphinx (TailBench, 1.5 qps), memcached, pr (GAPBS); donor stream_l. Every tenant priority 2. Values are graded by certify.py on the controller tail. Recovery differences between CATch and SpiderSense's harmless picks are within run-to-run noise (±8-12 pp); the separation is in harm, not recovery.
